

ABSTRACT

A mechanical device and system to expedite the check-out process, comprising a rail mounted vertically suspended partition panel 1, to separate orders at the check-out counter and a medium for advertising various products and services on said panel.

Vertical movement of the partition panel 1 is facilitated by way of the panel hinge 4, connected to the turret 5 which affords lateral mobility to said panel 1.

The turret base 6 houses bearings to facilitate movement along the travel rail 7 with end stops 9 preventing said turret base 6 from advancing beyond said travel rail's 7 linear limitations.

The partition panel hatch 2 provides easy access for the mounting of commercial display materials on either side of the partition panel 1, which are held securely in place by the partition panel frame 3.

Stability is maintained by attaching the entire system to the inside railing of the checkout counter 8 by way of the travel rail 7.
